

Succession - Station 6

1. Where does succession begin in this example? What organisms inhabit this initial community?
2. How do the original sediments arrive? What organisms will now grow first?
3. Summarize the next 3 progressions in this example of ecological succession.
4. Describe some of the organisms present in the climax community.
5. What type of succession could this be the result of? Explain your reasoning.

Succession doesn't only occur on land. Scan the QR code to the right to see how succession can occur even in wetlands.
